

How to Quickly Sync Lighting with Wireless DMX

Wireless DMX is great for simple, static lighting setups. Follow these steps to sync your lights:

Step 1: Configure Slave Lights

1. Turn on all the lights you want to sync.
2. Go to the **DMX512** menu and set all channels to **A001**.
3. Press the **Wireless DMX Code** button and choose a group color (7 options available).
4. The selected color will stay solid, indicating the slaves are configured.

Step 2: Configure the Master Light

1. Turn on the light to be used as the master.
2. Set it to **Color Mode**.
3. Press the **Wireless DMX Code** button until the color matches the group color chosen for the slaves.
4. Once synced, the slave lights will blink green, and the master will blink red, confirming a successful connection.
